

THREE C - Creating the Circular Carbon Economy

THREE C seeks to generate value from residual biomass for the provision of bioenergy and biobased products and services.

THREE C supports regional partners, entrepreneurs, SMEs, start-ups and innovators in North West Europe who wish to develop biochar-based businesses, products and services. Biochar is a material that has an ever-growing list of potential applications, encompassing the agricultural, horticultural, environmental and water treatment sectors alongside many more. In many cases, it can be reused or returned to land as a soil amendment, sequestering carbon in the process and giving rise to the circular carbon economy.

Have a look at the [THREE C Virtual Exhibition](#) with carbon products. It was developed to show the large range of biochar applications developed in THREE C. It provides profound additional multimedia information such as a fact sheet, photos and videos about the products and their developments and contacts to the inventors.
